

ACCRA-MARRAKECH AGENDA

Version 03.04.2023

[Framing language to follow]

The V20 Group, representing 58 of the world's most systemically climate-threatened economies, under Ghana's presidency of the Group, has outlined four fundamental priority areas to ensure a world economy fit-for-climate and supportive of its most vulnerable groups, which follow below. This begins with the need to mobilize an ambitious share of world GDP to secure a sustainable future for the global economy amid an escalating climate emergency, and a downscaling of financial resources that undermine the fight against climate change. This re-wiring of the global financial system must happen as soon as possible within the current decade. Against the backdrop of a global climate emergency, and launching this roadmap with the Accra V20 Senior Officials' Meeting in the spring of 2023, the V20 will work throughout the year, culminating at the Marrakech IMF and World Bank Annual Meetings, to cement an international coalition behind a fit-for-climate global financial system:

#1 MAKE DEBT WORK FOR THE CLIMATE- it is urgent that we make debt work for the most vulnerable and that we overcome the cost of capital hurdles.

What is needed:

- The G20 provides access for all debt distressed climate vulnerable developing economies to its Common Framework for debt treatments, and leverage this Framework to support financing development-positive climate actions.
- Credit enhancement should accompany debt restructuring (including shock resilient debt and swaps) to attract new investment for development-positive climate action, and incentives for existing creditors to participate early.
- given the climate insecure future for economies, debt treatment should support the enhancement of climate resilience and the transition to climate-smart development, inclusive debt-sustainability analysis considering the investment needs of national climate strategies and plans such as Climate Prosperity Plans.

#2 TRANSFORM THE INTERNATIONAL AND DEVELOPMENT FINANCIAL SYSTEM - there is sufficient financial resources and money supply (liquidity through the decade and savings) in the

world economy to transform economies but a decisive shift of financial flows is required to unlock the potential of the system. For as long as public international and development finance continue to support brown (carbon-intensive/climate-heating) and risky (non-climate future adapted) investments instead of green and resilient ones, the transformational potential of the transition is undermined.

What is needed is:

- A complete pre-2030 shift of public development and international finance from brown to green, and from risky to resilient, that begins now, shifting public financial support away from climate-incompatible investments and behind renewable energy, resilient infrastructure and nature-based solutions underpinned by development strategies into evolving Nationally Determined Contributions and Climate Prosperity Plans that can be enshrined in these strategies.
- Optimize the use of capital of MDBs/DFIs, adding momentum behind this shift by enabling higher lending ratios to capital for new investments that are green and resilient, and lowering lending ratios to capital for brown and risky investments, justified by the now evident reality of the different overall risk profiles that pertain to each class of investment.
- Increase the utilization of IMF Special Drawing Rights (SDRs) for development-positive climate action especially in most vulnerable economies, including through enhanced access to the Resilience and Sustainability Trust (RST).
- Recognition of Climate Prosperity Plans and other development-positive climate action investment plans to unlock beneficial SDR/RST access and rechanneling SDRs through DFIs.
- Support for development-positive climate investments in most vulnerable economies otherwise locked out from global capital markets to access these, such as through dedicated listing boards on major stock exchanges.
- Capital increases in multilateral development banks.

#3 A NEW GLOBAL DEAL ON CARBON FINANCING - we need a new global deal on carbon finance to realize the goal of the Paris Agreement in the near-term, prior to 1.5°C overshoot lock-in. This demands substantial strengthening of 2030 climate targets of major polluting economies that can be enabled through the promotion of ambitious development-positive climate action in low-emitting developing economies. Win-win carbon-finance exchanges can help meet global goals, deliver fair-share action, and provide crucial financial support for ambitious climate action that would otherwise not be viable.

What we need:

- All major polluting economies whose 2030 Paris Agreement emission targets fall short of its central goal - the 1.5°C limit - on a fair-shares basis (accounting for past

emissions, per head pollution, and wealth disparities) must strengthen these targets, starting in 2023, until full and equitable compliance is achieved.

- Make full use of the Paris Agreement's international emissions exchange instruments, and rapidly scale-up public cooperation with low-emitting developing economies, and especially most vulnerable economies, aimed at providing crucial financial support for development-positive climate action, such as Climate Prosperity Plan projects, in exchange for internationally transferred mitigation outcomes, enabling major polluting economies to meet more ambitious and equitable national emission targets.
- Alongside an upscaling intergovernmental global carbon exchange, link major polluting markets with low polluting markets so as to enable the private sector to exchange emissions outcomes and finance independent of public level cooperation, unlocking accelerated options for achieving net zero or carbon negative pathways.

#4 REVOLUTIONIZE RISK MANAGEMENT FOR OUR CLIMATE INSECURE WORLD ECONOMY-

we must double down on efforts to accept and address the new climate insecure reality of the world economy and put in place with anticipatory finance (pre-arranged and trigger-based funds) for loss and damage and mainstream surveillance and monitoring of climate risks of all kinds (physical, transition, spillover) in IFI finance and credit rating practices, including through the landmark G7-V20 Global Shield against Climate Risks.

What we need:

- Scale-up of pre-arranged financing options to tackle climate impacts and shocks especially for most vulnerable economies, improving the access, management, and delivery of resources ahead of time, instead of post-disaster responses underscored by efforts under the G7/V20 Global Shield.
- Increase the utilization of trigger-based design in relevant public and private financial instruments (financial protection, public external debt, risk transfer/sharing, among others), leveraging latest data and science to eclipse the prevailing practice of after-the-fact assessments, which, as mounting evidence continues to demonstrate, are inefficient and skew the burden of proof in further penalty for most vulnerable economies.
- Addition of a dedicated OECD DAC marker for climate-related loss and damage, in order to better track development finance contributions focused on addressing growing climate impacts and shocks among most vulnerable economies.
- Make universal surveillance of all climate risks inclusive of physical risks, transition risks and spillover risks systematically for every economy in IMF Article IV surveillance a reality as soon as possible prior to 2025.
- Financial regulators take action to ensure all leading credit rating agencies fully account for all climate risks (physical, transition, spillover) in their assessment methodologies of public and private economic entities and capital/debt instruments and securities (inclusive derivative markets) in order to incentivize climate action and penalize climate incompatible business and investment in the near-term (by 2025 at the latest).
